Conclusion

1

The Needham-Schroeder Public Key Protocol (1978):

1. $A \rightarrow S : A, B$
2. $S \rightarrow A : \{K_b, B\}_{K_s^{-1}}$
3. $A \rightarrow B : \{N_a, A\}_{K_b}$
4. $B \rightarrow S : B, A$
5. $S \rightarrow B : \{K_a, A\}_{K_s^{-1}}$
6. $B \rightarrow A : \{N_a, N_b, \textcolor{red}{B}\}_{K_a}$
7. $A \rightarrow B : \{N_b\}_{K_b}$

Man-in-the-middle attack presented by Gavin Lowe (1995).

Abilities of the attacker

Blanchet (2001)

Mikael Elkjaer
Christensen

Introduction

Overview

Protocol
representation

Definitions

Solving Algorithm

Conclusion

6

It is assumed that the protocol is executed in the presence of an attacker that can:

- ▶ intercept all messages,
- ▶ compute new messages from the messages it has received, and
- ▶ send any message it can build.

Blanchet (2001)

Mikael Elkjaer
Christensen

Introduction

Overview

Protocol
representation

Definitions

Solving Algorithm

Conclusion

7

A protocol can be represented by three sets of rules:

1. Rules representing the computation abilities of the attacker

$$\begin{aligned} & \textit{attacker}(x_1) \wedge \dots \wedge \textit{attacker}(x_n) \rightarrow \textit{attacker}(f(x_1, \dots, x_n)), \\ & \textit{attacker}(M_1) \wedge \dots \wedge \textit{attacker}(M_n) \rightarrow \textit{attacker}(M) \end{aligned}$$

2. Facts corresponding to initial knowledge of the attacker
3. Rules representing the protocol itself

$$\textit{attacker}(M_{j_1}) \wedge \dots \wedge \textit{attacker}(M_{j_n}) \rightarrow \textit{attacker}(M_i).$$

Protocol Needham-Schroeder Examples

Protocol
representation

Definitions

Solving Algorithm

Conclusion

8

1. Computation abilities

$$attacker(m) \wedge attacker(pk) \rightarrow attacker(\mathbf{pencrypt}(m, pk))$$

$$attacker(\mathbf{pencrypt}(m, \mathbf{pk}(sk))) \wedge attacker(sk) \rightarrow m$$

2. Initial facts

$$attacker(\mathbf{pk}(sk_S[])), attacker(A[]), attacker(B[])$$

3. Protocol rules

$$attacker(x) \rightarrow attacker(\mathbf{sign}(\mathbf{pk}(sk_x[]), sk_A[]))$$

Approximations

Blanchet (2001)

Mikael Elkjaer
Christensen

Introduction

Overview

Protocol
representation

Definitions

Solving Algorithm

Conclusion

9

- ▶ New names are functions of messages previously received, unless altered.
- ▶ The same step of a protocol can be completed several times, yielding the same result, provided that the previous steps have been completed.
- ▶ Correctness still holds – intuitively, more attacker options and safe, still safe with less options.
- ▶ However, can lead to false attacks.

Blanchet (2001)

Mikael Elkiær
Christensen

Introduction

Overview

Protocol
representation

Definitions

Solving Algorithm

Conclusion

10

- ▶ A hypotheses F_1, \dots, F_n of a rule are considered a multiset.
- ▶ A multiset of facts S is a function $S(F)$ yielding the number of repetitions of F in S .
- ▶ Giving a point-wise order on functions:
 $S \subseteq S' \Leftrightarrow \forall F, S(F) \leq S'(F)$.

Definition 2 (Derivability)

Blanchet (2001)

Mikael Elkiær
Christensen

Introduction

Overview

Protocol
representation

Definitions

Solving Algorithm

Conclusion

12

Let F be a closed fact. Let B be a set of rules. F is derivable from B if and only if there exists a finite tree defined as follows:

1. Its nodes (except the root) are labelled by rules $R \in B$;
2. Its edges are labelled by closed facts;
3. If the tree contains a node labelled by R with one incoming edge labelled by F_0 and n outgoing edges labelled by F_1, \dots, F_n , then $R \Rightarrow \{F_1, \dots, F_n\} \rightarrow F_0$.
4. The root has one outgoing edge, labelled by F .

19

Definition 3 (Resolution)

Blanchet (2001)

Mikael Elkjaer
Christensen

Introduction

Overview

Protocol
representation

Definitions

Solving Algorithm

Conclusion

13

Let R and R' be two rules. $R = H \rightarrow C, R' = H' \rightarrow C'$.

Assume there exists $F_0 \in H'$ such that: C and F_0 are unifiable, and σ is the most general unifier of C and F_0 .

In this case, we define

$$R \circ_{F_0} R' = \sigma(H \cup (H' - F_0)) \rightarrow \sigma C'.$$

19

First phase: completion of the rule base

Blanchet (2001)

Mikael Elkiær
Christensen

Introduction

Overview

Protocol
representation

Definitions

Solving Algorithm

Conclusion

14

Let $B = \emptyset$ and let B_0 be the initial set of rules.

1. For each $R \in B_0$, $B \leftarrow \text{add}(\text{elimdup}(R), B)$.
2. Let $R \in B$, $R = H \rightarrow C$ and $R' \in B$, $R' = H' \rightarrow C'$.
Assume that there exists $F_0 \in H'$ such that:

- a) $R \circ_{F_0} R'$ is defined;
- b) $\forall F \in H, F \in_r S$;
- c) $F_0 \notin_r S$.

In this case, we execute

$$B \leftarrow \text{add}(\text{elimdup}(R \circ_{F_0} R'), B).$$

This procedure is executed until a fixed point is reached.

3. Let $B' = \{(H \rightarrow C) \in B \mid \forall F \in H, F \in_r S\}$.

Second phase: backward depth-first search

Blanchet (2001)

Mikael Elkjaer
Christensen

Introduction

Overview

Protocol
representation

Definitions

Solving Algorithm

Conclusion

16

We define **derivablerec**(R, B'') by

1. **derivablerec**(R, B'') = \emptyset if $\exists R' \in B'', R' \Rightarrow R$;
2. **derivablerec**($\emptyset \rightarrow C, B''$) = $\{C\}$ otherwise;
3. **derivablerec**(R, B'') =
 $\cup \{ \mathbf{derivablerec}(\mathbf{elimdup}(R' \circ_{F_0} R), \{R\} \cup B'') \mid R' \in B', F_0$
such that $R' \circ_{F_0} R$ is defined $\}$ otherwise.

derivable(F) = **derivablerec**($\{F\} \rightarrow F, \emptyset$).

19

Theorem 2 (Correctness)

Blanchet (2001)

Mikael Elkjaer
Christensen

Introduction

Overview

Protocol
representation

Definitions

Solving Algorithm

Conclusion

17

Let F be a closed fact. Let F' such that there exists a substitution σ such that $\sigma F' = F$. F is derivable from the rules in B_0 if and only if $\exists F'' \in \mathbf{derivable}(F'), \exists \sigma, F = \sigma F''$. In particular, F is derivable from B_0 if and only if $F \in \mathbf{derivable}(F)$.
